# Compiler pipeline

# Compiler pipeline and formal languages

# Compiler pipeline with the $\Pi$ Framework I

# Compiler pipeline with the $\Pi$ Framework II

- $\Pi$  IR defines a set of constructions common to many programming languages.
- $\Pi$  IR constructions have a formal automata-based semantics in  $\Pi$  automata.
- One may execute (or validate) a program in a given language by running its associated  $\Pi$  IR program.

# A calculator

We wish to compute simple arithmetic expressions such as  $5 * (3 + 2)$ .

# A calculator: Lexer

$\langle \textit{digit} \rangle ::= [0..9]$

$\langle \textit{digits} \rangle ::= \langle \textit{digit} \rangle^+$

$\langle \textit{boolean} \rangle ::= \text{'true'} \mid \text{'false'}$

# A calculator: concrete syntax

$\langle \text{exp} \rangle ::= \langle \text{aexp} \rangle \mid \langle \text{bexp} \rangle$

$\langle \text{aexp} \rangle ::= \langle \text{aexp} \rangle '+' \langle \text{term} \rangle \mid \langle \text{aexp} \rangle '-' \langle \text{term} \rangle \mid \langle \text{term} \rangle$

$\langle \text{term} \rangle ::= \langle \text{term} \rangle '*' \langle \text{factor} \rangle \mid \langle \text{term} \rangle '/' \langle \text{factor} \rangle \mid \langle \text{factor} \rangle$

$\langle \text{factor} \rangle ::= '(' \langle \text{aexp} \rangle ')' \mid \langle \text{digits} \rangle$

$\langle \text{bexp} \rangle ::= \langle \text{boolean} \rangle \mid \sim \langle \text{bexp} \rangle \mid \langle \text{bexp} \rangle \langle \text{boolop} \rangle \langle \text{bexp} \rangle$   
 $\mid \langle \text{aexp} \rangle \langle \text{iop} \rangle \langle \text{aexp} \rangle$

$\langle \text{boolop} \rangle ::= '=' \mid '/\backslash' \mid '\backslash/'$

$\langle \text{iop} \rangle ::= '<' \mid '>' \mid '<=' \mid '>='$

# A calculator: abstract syntax

$$\langle exp \rangle ::= \langle digits \rangle \mid \langle boolean \rangle \mid \langle exp \rangle \langle bop \rangle \langle exp \rangle$$
$$\langle bop \rangle ::= '+' \mid '-' \mid '*' \mid '/' \mid '=' \mid '\backslash' \mid '\wedge' \mid '<' \mid '>' \mid '<=' \mid '>='$$

# A calculator: $\Pi$ denotations I

Let  $D$  in  $\langle \text{digits} \rangle$ ,  $B$  in  $\langle \text{boolean} \rangle$  and  $E_1, E_2$  in  $\langle \text{exp} \rangle$ ,

$$\llbracket D \rrbracket_{\Pi} = \text{Num}(D) \quad (1)$$

$$\llbracket B \rrbracket_{\Pi} = \text{Boo}(B) \quad (2)$$

$$\llbracket E_1 + E_2 \rrbracket_{\Pi} = \text{Sum}(\llbracket E_1 \rrbracket_{\Pi}, \llbracket E_2 \rrbracket_{\Pi}) \quad (3)$$

$$\llbracket E_1 - E_2 \rrbracket_{\Pi} = \text{Sub}(\llbracket E_1 \rrbracket_{\Pi}, \llbracket E_2 \rrbracket_{\Pi}) \quad (4)$$

$$\llbracket E_1 * E_2 \rrbracket_{\Pi} = \text{Mul}(\llbracket E_1 \rrbracket_{\Pi}, \llbracket E_2 \rrbracket_{\Pi}) \quad (5)$$

$$\llbracket E_1 / E_2 \rrbracket_{\Pi} = \text{Div}(\llbracket E_1 \rrbracket_{\Pi}, \llbracket E_2 \rrbracket_{\Pi}) \quad (6)$$

$$\llbracket E_1 < E_2 \rrbracket_{\Pi} = \text{Lt}(\llbracket E_1 \rrbracket_{\Pi}, \llbracket E_2 \rrbracket_{\Pi}) \quad (7)$$

$$\llbracket E_1 \leq E_2 \rrbracket_{\Pi} = \text{Le}(\llbracket E_1 \rrbracket_{\Pi}, \llbracket E_2 \rrbracket_{\Pi}) \quad (8)$$

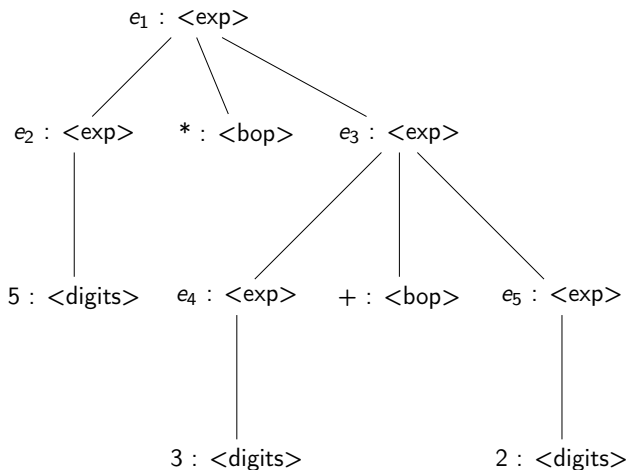

$$\llbracket E_1 > E_2 \rrbracket_{\Pi} = \text{Gt}(\llbracket E_1 \rrbracket_{\Pi}, \llbracket E_2 \rrbracket_{\Pi}) \quad (9)$$

$$\llbracket E_1 \geq E_2 \rrbracket_{\Pi} = \text{Ge}(\llbracket E_1 \rrbracket_{\Pi}, \llbracket E_2 \rrbracket_{\Pi}) \quad (10)$$

# A calculator: $\Pi$ denotations II

- $\Pi$  denotations are *functions*  $\llbracket \cdot \rrbracket_{\Pi} : AST \rightarrow \Pi \text{ IR}$ , where *AST* denotes the *datatype* for the abstract syntax tree and  $\Pi \text{ IR}$  denotes the datatype for  $\Pi \text{ IR}$  programs.
- Note that  $\llbracket \cdot \rrbracket_{\Pi}$  has *trees* as parameters, instances of *AST*. The example expression  $5 * (3 + 2)$  becomes

# A calculator: $\Pi$ denotations III

# A calculator: $\Pi$ denotations IV

$$\llbracket 5 * (3 + 2) \rrbracket_{\Pi} = \text{Mul}(\llbracket 5 \rrbracket_{\Pi}, \llbracket (3 + 2) \rrbracket_{\Pi}) \quad \text{by Equation 5}$$

$$\text{Mul}(\llbracket 5 \rrbracket_{\Pi}, \llbracket (3 + 2) \rrbracket_{\Pi}) = \text{Mul}(\text{Num}(5), \llbracket (3 + 2) \rrbracket_{\Pi}) \quad \text{by Equation 1}$$

$$\text{Mul}(\text{num}(5), \llbracket (3 + 2) \rrbracket_{\Pi}) = \text{Mul}(\text{Num}(5), \text{Sum}(\llbracket 3 \rrbracket_{\Pi}, \llbracket 2 \rrbracket_{\Pi})) \quad \text{by Equation 3}$$

$$\text{Mul}(\text{Num}(5), \text{Sum}(\llbracket 3 \rrbracket_{\Pi}, \llbracket 2 \rrbracket_{\Pi})) = \text{Mul}(\text{Num}(5), \text{Sum}(\text{Num}(3), \llbracket 2 \rrbracket_{\Pi})) \quad \text{by Equation 1}$$

$$\text{Mul}(\text{Num}(5), \text{Sum}(\text{Num}(3), \llbracket 2 \rrbracket_{\Pi})) = \text{Mul}(\text{Num}(5), \text{Sum}(\text{Num}(3), \text{Num}(2))) \quad \text{by Equation 1}$$

# A calculator: executing $\Pi$ IR with $\Pi$ automata

A  $\Pi$  automaton is a 5-tuple  $\mathcal{A} = (G, Q, \delta, q_0, F)$ , where  $G$  is a context-free grammar,  $Q$  is the set of states,  $q_0$  is the initial state,  $F \subseteq Q$  is the set of final states and

$$\delta : L(G)^* \times L(G)^* \times Store \rightarrow Q,$$

where  $L(G)$  is the language generated by  $G$  and  $Store$  represents the memory. (Elements in a set  $S^*$  are represented by terms  $[s_1, s_2, \dots, s_n].$ )

$$\begin{aligned} \delta([Mul(Num(5), Sum(Num(3), Num(2))), \emptyset, \emptyset) &= \delta([Num(5), Sum(Num(3), Num(2)), \#MUL], \emptyset, \emptyset) \\ \delta([Num(5), Sum(Num(3), Num(2)), \#MUL], \emptyset, \emptyset) &= \delta([Sum(Num(3), Num(2)), \#MUL], [Num(5)], \emptyset) \\ \delta([Sum(Num(3), Num(2)), \#MUL], [Num(5)], \emptyset) &= \delta([Num(3), Num(2), \#SUM, \#MUL], [Num(5)], \emptyset) \\ \delta([Num(3), Num(2), \#SUM, \#MUL], [Num(5)], \emptyset) &= \delta([Num(2), \#SUM, \#MUL], [Num(3), Num(5)], \emptyset) \\ \delta([Num(2), \#SUM, \#MUL], [Num(3), Num(5)], \emptyset) &= \delta([\#SUM, \#MUL], [Num(2), Num(3), Num(5)], \emptyset) \\ \delta([\#SUM, \#MUL], [Num(2), Num(3), Num(5)], \emptyset) &= \delta([\#MUL], [Num(5), Num(5)], \emptyset) \\ \delta([\#MUL], [Num(5), Num(5)], \emptyset) &= \delta(\emptyset, [Num(25)], \emptyset) \\ \delta(\emptyset, [Num(25)], \emptyset) &= Num(25) \end{aligned}$$

Excerpt of  $\Pi$  IR expressions

$\langle \textit{Statement} \rangle ::= \langle \textit{Exp} \rangle$

$\langle \textit{Exp} \rangle ::= \langle \textit{ArithExp} \rangle \mid \langle \textit{BoolExp} \rangle \langle \textit{Exp} \rangle$

$\langle \textit{ArithExp} \rangle ::= \text{'Num'}(\langle \textit{digits} \rangle) \mid \text{'Sum'}(\langle \textit{Exp} \rangle, \langle \textit{Exp} \rangle) \mid$   
 $\text{'Sub'}(\langle \textit{Exp} \rangle, \langle \textit{Exp} \rangle) \mid \text{'Mul'}(\langle \textit{Exp} \rangle, \langle \textit{Exp} \rangle)$

$\langle \textit{BoolExp} \rangle ::= \text{'Eq'}(\langle \textit{Exp} \rangle, \langle \textit{Exp} \rangle) \mid \text{'Not'}(\langle \textit{Exp} \rangle)$

# $\Pi$ automaton semantics for $\Pi$ IR expressions I

- Recall that  $\delta : L(G)^* \times L(G)^* \times Store \rightarrow Q$ , and let  $N, N_i \in \mathbb{N}$ ,  $C, V \in L(G)^*$ ,  $S \in Store$ ,

$$\delta(Num(N) :: C, V, S) = \delta(C, Num(N) :: V, S) \quad (11)$$

$$\delta(Sum(E_1, E_2) :: C, V, S) = \delta(E_1 :: E_2 :: \#SUM :: C, V, S) \quad (12)$$

$$\delta(\#SUM :: C, Num(N_1) :: Num(N_2) :: V, S) = \delta(C, (N_1 + N_2) :: V, S) \quad (13)$$

...

$$\delta(Not(E) :: C, V, S) = \delta(E :: \#NOT :: C, V, S) \quad (14)$$

$$\delta(\#NOT :: C, Boo(true) :: V, S) = \delta(C, Boo(false) :: V, S) \quad (15)$$

$$\delta(\#NOT :: C, Boo(false) :: V, S) = \delta(C, Boo(true) :: V, S) \quad (16)$$

- Notation  $h :: ls$  denotes the concatenation of element  $h$  with the list  $ls$ .
- $C$  represents the *control* stack.  $V$  represents the *value* stack.  $S$  denotes the memory store.
- $\delta(\emptyset, V, S)$  denotes an *accepting state*.

# $\Pi$ automaton semantics for $\Pi$ IR expressions II

- On a particular implementation of the  $\Pi$  Framework, as in Python, `<digits>` denote built-in numbers in implementation language, such that all arithmetic operations, such as `+`, are defined. That's why  $N_i$  are in  $\mathbb{N}$ .

## $\Pi$ IR commands

- Commands are language constructions that require a *memory* store to be evaluated.

$\langle \text{Statement} \rangle ::= \langle \text{Cmd} \rangle$

$\langle \text{Exp} \rangle ::= \text{'Id'}(\langle \text{String} \rangle)$

$\langle \text{Cmd} \rangle ::= \begin{array}{l} \text{'Assign'}(\langle \text{Id} \rangle, \langle \text{Exp} \rangle) \\ | \text{'Loop'}(\langle \text{BoolExp} \rangle, \langle \text{Cmd} \rangle) \\ | \text{'CSeq'}(\langle \text{Cmd} \rangle, \langle \text{Cmd} \rangle) \end{array}$

# $\Pi$ automaton semantics for $\Pi$ IR commands I

- A location  $l \in Loc$  denotes a memory cell.
- Storable and Bindable sets denote the data that may be mapped to by identifiers and locations on the memory and environment respectively.
- $Store = Loc \mapsto Storable$ ,  $Env = Id \mapsto Bindable$ ,  $Loc \subseteq Storable$ ,  $\mathbb{N} \subseteq Loc, Bindable$ .
- Now the transition function is  $\delta : L(G)^* \times L(G)^* \times Env \times Store \rightarrow Q$ , and let  $W \in String$ ,  $C, V \in L(G)^*$ ,  $S \in Store$ ,  $E \in Env$ ,  $B \in Bindable$ ,  $l \in Loc$ ,  $T \in Storable$ ,  $X \in \langle Exp \rangle$ ,  $M, M_1, M_2 \in \langle Cmd \rangle$ , and

# $\Pi$ automaton semantics for $\Pi$ IR commands II

expression  $S' = S/[I \mapsto N]$  means that  $S'$  equals to  $S$  in all indices but  $I$  that is bound to  $N$ ,

$$\delta(Id(W) :: C, V, E, S) = \delta(C, B :: V, E, S), \quad (17)$$

$$\text{where } E[W] = I \text{ and } S[I] = B,$$

$$\delta(Assign(W, X) :: C, V, E, S) = \delta(X :: \#ASSIGN :: C, W :: V, E, S'), \quad (18)$$

$$\delta(\#ASSIGN :: C, T :: W :: V, E, S) = \delta(C, V, E, S'), \quad (19)$$

$$\text{where } E[W] = I \text{ and } S' = S/[I \mapsto T],$$

$$\delta(Loop(X, M) :: C, V, E, S) = \delta(X :: \#LOOP :: C, Loop(X, M) :: V, E, S), \quad (20)$$

$$\delta(\#LOOP :: C, Bool(true) :: Loop(X, M) :: V, E, S) = \delta(M :: Loop(X, M) :: C, V, E, S), \quad (21)$$

$$\delta(\#LOOP :: C, Bool(false) :: Loop(X, M) :: V, E, S) = \delta(C, V, E, S), \quad (22)$$

$$\delta(CSeq(M_1, M_2) :: C, V, E, S) = \delta(M_1 :: M_2 :: C, V, E, S). \quad (23)$$

## $\Pi$ IR declarations

- Declarations are statements that create an environment, binding identifiers to (bindable) values.
- In  $\Pi$  IR, a bindable value is either a Boolean value, an integer or a location.
- From a syntactic standpoint, all classes are monotonically extended.

$\langle \text{Statement} \rangle ::= \langle \text{Dec} \rangle$

$\langle \text{Exp} \rangle ::= \text{'Ref'}(\langle \text{Exp} \rangle) \mid \text{'DeRef'}(\langle \text{Id} \rangle) \mid \text{'ValRef'}(\langle \text{Id} \rangle)$

$\langle \text{Dec} \rangle ::= \text{'Bind'}(\langle \text{Id} \rangle, \langle \text{Exp} \rangle) \mid \text{'DSeq'}(\langle \text{Dec} \rangle, \langle \text{Dec} \rangle)$

$\langle \text{Cmd} \rangle ::= \text{'Blk'}(\langle \text{Dec} \rangle, \langle \text{Cmd} \rangle)$

## $\Pi$ automaton semantics for $\Pi$ IR declarations I

Let  $BlockLocs = \mathcal{P}(Loc)$ , now the transition function is  $\delta : L(G)^* \times L(G)^* \times Env \times Store \times BlockLocs \rightarrow Q$ , and let  $L, L' \in BlockLocs$ ,  $Loc \subseteq Storable$ , and  $S/L$  means the store  $S$  without the locations in  $L$ ,

$\Pi$  automaton semantics for  $\Pi$  IR declarations II

$$\delta(\text{Ref}(X) :: C, V, E, S, L) = \delta(X :: \#REF :: C, V, E, S, L), \quad (24)$$

$$\delta(\#REF :: C, T :: V, E, S, L) = \delta(C, I :: V, E, S', L'), \text{where } S' = S \cup [I \mapsto T], I \notin S, L' = L \cup \{I\}, \quad (25)$$

$$\delta(\text{DeRef}(\text{Id}(W)) :: C, V, E, S, L) = \delta(C, I :: V, E, S, L), \text{where } I = E[W], \quad (26)$$

$$\delta(\text{ValRef}(\text{Id}(W)) :: C, V, E, S, L) = \delta(C, T :: V, E, S, L), \text{where } T = S[S[E[W]]], \quad (27)$$

$$\delta(\text{Bind}(\text{Id}(W), X) :: C, V, E, S, L) = \delta(X :: \#BIND :: C, W :: V, E, S, L), \quad (28)$$

$$\delta(\#BIND :: C, B :: W :: H :: V, E, S, L) = \delta(C, [W \mapsto B] :: V, E, S, L), \quad (29)$$

$$\delta(\text{DSeq}(D_1, D_2), X) :: C, V, E, S, L) = \delta(D_1 :: D_2 :: \#DSEQ :: C, V, E, S, L), \quad (30)$$

$$\delta(\#DSEQ :: C, E :: E' :: H :: V, E, S, L) = \delta(C, (E \cup E') :: H :: V, E, S, L), \text{where } E' \in \text{Env}, H \notin \text{Env}, \quad (31)$$

$$\delta(\text{Blk}(D, M) :: C, V, E, S, L) = \delta(D :: \#BLKDEC :: C, M :: L :: V, E, S, \emptyset), \quad (32)$$

$$\delta(\#BLKDEC :: C, E' :: V, E, S, L) = \delta(M :: \#BLKCMD :: C, E :: V, E \setminus E', S, L), \quad (33)$$

$$\delta(\#BLKCMD :: C, E :: L :: V, E', S, L') = \delta(C, V, E, S', L), \text{ where } S' = S/L. \quad (34)$$

## $\Pi$ IR abstractions

- Abstractions extend Bindables by allowing a name to be bound to a list of formal parameters, a list of identifiers, and a block in the environment.
- Such names can be called and applied to actual parameters, a list of expressions.

$\langle Dec \rangle \quad ::= \text{'Bind'}(\langle Id \rangle, \langle Abs \rangle)$

$\langle Abs \rangle \quad ::= \text{'Abs'}(\langle Formals \rangle, \langle Blk \rangle)$

$\langle Formals \rangle \quad ::= \langle Id \rangle^*$

$\langle Cmd \rangle \quad ::= \text{'Call'}(\langle Id \rangle, \langle Actuals \rangle)$

$\langle Actuals \rangle \quad ::= \langle Exp \rangle^*$

# $\Pi$ automaton semantics for $\Pi$ IR abstractions — Closures I

We chose a *static binding* semantics for abstractions. Therefore, we interpret abstractions as *closures* formed by an abstraction together with its declaration environment which defines the context in which the abstraction will be evaluated.

$$\textit{Closure} : \textit{Formals} \times \textit{Blk} \times \textit{Env} \rightarrow \textit{Bindable}$$

# $\Pi$ automaton semantics for $\Pi$ IR abstractions — Example I

```
1 |m\Pi source code:
2 |# In this example we encapsulate the iterative calculation
3 |# of the factorial within a function call.
4 |let var z = 1
5 |in
6 |    let fn f(x) =
7 |        let var y = x
8 |        in
9 |            while not (y == 0)
10 |            do
11 |                z := z * y
12 |                y := y - 1
13 |in f(10)
```

$\Pi$  automaton semantics for  $\Pi$  IR abstractions — Example II

```
1  $\Pi$  IR AST:  
2 Blk(Bind(Id(z), Ref(Num(1))),  
3   Blk(Bind(Id(f), Abs(Id(x),  
4     Blk(Bind(Id(y), Ref(Id(x))),  
5       Loop(Not(Eq(Id(y), Num(0))),  
6         CSeq(Assign(Id(z), Mul(Id(z), Id(y))),  
7           Assign(Id(y), Sub(Id(y), Num(1)))))))))  
8   Call(Id(f), Num(10)))
```

# $\Pi$ automaton semantics for $\Pi$ IR abstractions I

Let  $F \in \text{Formals}$ ,  $B \in \text{Blk}$ ,  $I \in \text{Id}$ ,  $A \in \text{Actuals}$ ,  $V_i \in \text{Value}$ ,  $1 \leq i \leq n$ ,  $n \in \mathbb{N}$ ,

$$\delta(\text{Abs}(F, B) :: C, V, E, S, L) = \delta(C, \text{Closure}(F, B, E) :: V, E, S, L) \quad (35)$$

$$\begin{aligned} \delta(\text{Call}(I, [X_1, X_2, \dots, X_n])) :: C, V, E, S, L) = \\ \delta(X_n :: X_{n-1} :: \dots :: X_1 :: \# \text{CALL}(I, n) :: C, V, E, S, L) \end{aligned} \quad (36)$$

$$\begin{aligned} \delta(\# \text{CALL}(I, n) :: C, (V_1 :: V_2 :: \dots V_n :: V), E, S, L) = \\ \delta(B :: \# \text{BLKCMD} :: C, E :: V, E', S, L) \end{aligned} \quad (37)$$

**where**  $E = \{I \mapsto \text{Closure}(F, B, E_1)\} \cup E_2$ ,  
 $E' = E / E_1 / \text{match}(F, [V_1, V_2, \dots, V_n])$

# $\Pi$ automaton semantics for $\Pi$ IR abstractions II

$$match : Id^* \times Values^* \rightarrow Env$$

$$match(fl, al) = \text{if } |fl| \neq |al| \text{ then } \{\} \text{ else } \_match(fl, al, \{\})$$

$$\_match : Id^* \times Values^* \times Env \rightarrow Env$$

$$\_match([], [], E) = E$$

$$\_match(f, a, E) = \{f \mapsto a\} \cup E$$

$$\_match(f :: fl, a :: al, E) = \_match(fl, al, \{f \mapsto a\} \cup E)$$

## $\Pi$ IR recursive abstractions

- Abstractions can be recursive to allow for the declaration of recursive functions.

$\langle Dec \rangle \quad ::= \text{'Rbnd'}(\langle Id \rangle, \langle Abs \rangle)$

# $\Pi$ automaton semantics for $\Pi$ IR recursive abstractions — Recursive closures I

In the context of *static binding* semantics for abstractions, in a call to a recursive function, the evaluation of identifiers needs to be reminded about the binding of the function name to a closure.

$$Rec : Formals \times Blk \times Env \times Env \rightarrow Bindable$$
$$unfold : Env \rightarrow Env$$
$$reclose_E : Env \rightarrow Env$$

# $\Pi$ automaton semantics for $\Pi$ IR recursive abstractions — Recursive closures II

$$\text{unfold}(E) = \text{reclose}_E(E) \quad (38)$$

$$\text{reclose}_E(I \mapsto \text{Closure}(F, B, E')) = (I \mapsto \text{Rec}(F, B, E', E)) \quad (39)$$

$$\text{reclose}_E(I \mapsto \text{Rec}(F, B, E', E'')) = (I \mapsto \text{Rec}(F, B, E', E)) \quad (40)$$

$$\text{reclose}_E(I \mapsto v) = (I \mapsto v) \text{ if } v \neq \text{Closure}(F, B, E) \quad (41)$$

$$\text{reclose}_E(E_1 \cup E_2) = \text{reclose}_E(E_1) \cup \text{reclose}_E(E_2) \quad (42)$$

$$\text{reclose}_E(\emptyset) = \emptyset \quad (43)$$

# $\Pi$ automaton semantics for $\Pi$ IR recursive abstractions — Recursive closures I

$$\begin{aligned} \delta(Rbnd(I, Abs(F, B)) :: C, V, E, S, L) = \\ \delta(C, unfold(I \mapsto Closure(F, B, E)) :: V, E, S, L) \end{aligned} \quad (44)$$

$$\begin{aligned} \delta(\#CALL(I, n) :: C, V_1 :: V_2 :: \dots :: V_n :: V, E, S, L) = \\ \delta(B :: \#BLKCMD :: C, E :: V, E', S, L) \end{aligned} \quad (45)$$

**where**  $E = \{I \mapsto Rec(F, B, E_1, E_2)\} \cup E_3$ ,  
 $E' = E / E_1 / unfold(E_2) / match(F, [V_1, V_2, \dots, V_n])$

# $\Pi$ IR expressions in Python I
