A calculator

We wish to compute simple arithmetic expressions such as $5 * (3 + 2)$.

A calculator: Lexer

$\langle digit \rangle$ $::= [0..9]$

$\langle digits \rangle$ $::= \langle digit \rangle^+$

$\langle boolean \rangle$ $::=$ 'true' | 'false'

A calculator: concrete syntax

$\langle exp \rangle$ ::= $\langle aexp \rangle$ | $\langle bexp \rangle$

$\langle aexp \rangle$ ::= $\langle aexp \rangle$ '+' $\langle term \rangle$ | $\langle aexp \rangle$ '-' $\langle term \rangle$ | $\langle term \rangle$

$\langle term \rangle$ ::= $\langle term \rangle$ '*' $\langle factor \rangle$ | $\langle term \rangle$ '/' $\langle factor \rangle$ | $\langle factor \rangle$

$\langle factor \rangle$ ::= '(' $\langle aexp \rangle$ ')' | $\langle digits \rangle$

$\langle bexp \rangle$ ::= $\langle boolean \rangle$ | '~' $\langle bexp \rangle$ | $\langle bexp \rangle$ $\langle boolop \rangle$ $\langle bexp \rangle$
                  | $\langle aexp \rangle$ $\langle iop \rangle$ $\langle aexp \rangle$

$\langle boolop \rangle$ ::= '=' | '/\\' | '\\/'

$\langle iop \rangle$ ::= '<' | '>' | '<=' | '>='

A calculator: abstract syntax

$\langle exp \rangle$ ::= $\langle digits \rangle$ | $\langle boolean \rangle$ | $\langle exp \rangle$ $\langle bop \rangle$ $\langle exp \rangle$

$\langle bop \rangle$ ::= '+' | '-' | '*' | '/' | '=' | '\/' | '/\' | '<' | '>' | '<=' | '>='

A calculator: π denotations I

Let D in <digits>, B in <boolean> and E_1, E_2 in <exp>,

$$\llbracket D \rrbracket_\pi = Num(D) \tag{1}$$

$$\llbracket B \rrbracket_\pi = Boo(B) \tag{2}$$

$$\llbracket E_1 + E_2 \rrbracket_\pi = Sum(\llbracket E_1 \rrbracket_\pi, \llbracket E_2 \rrbracket_\pi) \tag{3}$$

$$\llbracket E_1 - E_2 \rrbracket_\pi = Sub(\llbracket E_1 \rrbracket_\pi, \llbracket E_2 \rrbracket_\pi) \tag{4}$$

$$\llbracket E_1 * E_2 \rrbracket_\pi = Mul(\llbracket E_1 \rrbracket_\pi, \llbracket E_2 \rrbracket_\pi) \tag{5}$$

$$\llbracket E_1 / E_2 \rrbracket_\pi = Div(\llbracket E_1 \rrbracket_\pi, \llbracket E_2 \rrbracket_\pi) \tag{6}$$

$$\llbracket E_1 < E_2 \rrbracket_\pi = Lt(\llbracket E_1 \rrbracket_\pi, \llbracket E_2 \rrbracket_\pi) \tag{7}$$

$$\llbracket E_1 <= E_2 \rrbracket_\pi = Le(\llbracket E_1 \rrbracket_\pi, \llbracket E_2 \rrbracket_\pi) \tag{8}$$

$$\llbracket E_1 > E_2 \rrbracket_\pi = Gt(\llbracket E_1 \rrbracket_\pi, \llbracket E_2 \rrbracket_\pi) \tag{9}$$

$$\llbracket E_1 >= E_2 \rrbracket_\pi = Ge(\llbracket E_1 \rrbracket_\pi, \llbracket E_2 \rrbracket_\pi) \tag{10}$$

A calculator: π denotations II

- π denotations are *functions* $[\![\cdot]\!]_\pi : AST \rightarrow \pi$ *lib*, where *AST* denotes the *datatype* for the abstract syntax tree and π *lib* denotes the datatype for π *lib* programs.

- Note that $[\![\cdot]\!]_\pi$ has *trees* as parameters, instances of *AST*. The example expression $5 * (3 + 2)$ becomes

A calculator: π denotations III

A calculator: π denotations IV

$$[\![5*(3+2)]\!]_\pi = Mul([\![5]\!]_\pi, [\![(3+2)]\!]_\pi) \qquad \text{by Equation 5}$$

$$Mul([\![5]\!]_\pi, [\![(3+2)]\!]_\pi) = Mul(Num(5), [\![(3+2)]\!]_\pi) \qquad \text{by Equations 1}$$

$$Mul(num(5), [\![(3+2)]\!]_\pi) = Mul(Num(5), Sum([\![3]\!]_\pi, [\![2]\!]_\pi)) \qquad \text{by Equation 3}$$

$$Mul(Num(5), Sum([\![3]\!]_\pi, [\![2]\!]_\pi)) = Mul(Num(5), Sum(Num(3), [\![2]\!]_\pi)) \qquad \text{by Equation 1}$$

$$Mul(Num(5), Sum(Num(3), [\![2]\!]_\pi)) = Mul(Num(5), Sum(Num(3), Num(2))) \qquad \text{by Equation 1}$$

A calculator: executing π lib with π automata

A π automaton is a 5-tuple $\mathscr{A} = (G, Q, \delta, q_0, F)$, where G is a context-free grammar, Q is the set of states, q_0 is the initial state, $F \subseteq Q$ is the set of final states and

$$\delta : L(G)^* \times L(G)^* \times Store \to Q,$$

where $L(G)$ is the language generated by G and $Store$ represents the memory. (Elements in a set S^* are represented by terms $[s_1, s_2, \ldots, s_n]$.)

$$\delta([Mul(Num(5), Sum(Num(3), Num(2))], \varnothing, \varnothing) = \delta([Num(5), Sum(Num(3), Num(2)), \#MUL], \varnothing, \varnothing)$$

$$\delta([Num(5), Sum(Num(3), Num(2)), \#MUL], \varnothing, \varnothing) = \delta([Sum(Num(3), Num(2)), \#MUL], [Num(5)], \varnothing)$$

$$\delta([Sum(Num(3), Num(2)), \#MUL], [Num(5)], \varnothing) = \delta([Num(3), Num(2), \#SUM, \#MUL], [Num(5)], \varnothing)$$

$$\delta([Num(3), Num(2), \#SUM, \#MUL], [Num(5)], \varnothing) = \delta([Num(2), \#SUM, \#MUL], [Num(3), Num(5)], \varnothing)$$

$$\delta([Num(2), \#SUM, \#MUL], [Num(3), Num(5)], \varnothing) = \delta([\#SUM, \#MUL], [Num(2), Num(3), Num(5)], \varnothing)$$

$$\delta([\#SUM, \#MUL], [Num(2), Num(3), Num(5)], \varnothing) = \delta([\#MUL], [Num(5), Num(5)], \varnothing)$$

$$\delta([\#MUL], [Num(5), Num(5)], \varnothing) = \delta(\varnothing, [Num(25)], \varnothing)$$

$$\delta(\varnothing, [Num(25)], \varnothing) = Num(25)$$

Excerpt of π lib expressions

⟨*Statement*⟩   ::= <Exp>

⟨*Exp*⟩   ::= <ArithExp> | <BoolExp>

⟨*ArithExp*⟩   ::= 'Num'(<digits>) | 'Sum'(<Exp> , <Exp>) |
                     'Sub'(<Exp>, <Exp>) | 'Mul'(<Exp>, <Exp>)

⟨*BoolExp*⟩   ::= 'Eq'(<Exp>, <Exp>) | 'Not'(<Exp>)

π automaton semantics for π lib expressions

- Recall that $\delta : L(G)^* \times L(G)^* \times Store \to Q$, and let $N, N_i \in \mathbb{N}$, $C, V \in L(G)^*$, $S \in Store$,

$$\delta(Num(N) :: C, V, S) = \delta(C, Num(N) :: V, S) \tag{11}$$

$$\delta(Sum(E_1, E_2) :: C, V, S) = \delta(E_1 :: E_2 :: \#SUM :: C, V, S) \tag{12}$$

$$\delta(\#SUM :: C, Num(N_1) :: Num(N_2) :: V, S) = \delta(C, Num(N_1 + N_2) :: V, S) \tag{13}$$

$$\dots$$

$$\delta(Not(E) :: C, V, S) = \delta(E :: \#NOT :: C, V, S) \tag{14}$$

$$\delta(\#NOT :: C, Boo(true) :: V, S) = \delta(C, Boo(false) :: V, S) \tag{15}$$

$$\delta(\#NOT :: C, Boo(false) :: V, S) = \delta(C, Boo(true) :: V, S) \tag{16}$$

- Notation $h :: ls$ denotes the concatenation of element h with the list ls.
- C represents the *control* stack. V represents the *value* stack. S denotes the memory store.
- $\delta(\emptyset, V, S)$ denotes an *accepting state*.

π lib commands

- Commands are language constructions that require both an *environment* and a *memory* store to be evaluated.

  ⟨*Statement*⟩   ::= <Cmd>

  ⟨*Exp*⟩   ::= 'Id'(<String>)

  ⟨*Cmd*⟩   ::= 'Assign'(<Id>, <Exp>)
                  | 'Loop'(<BoolExp>, <Cmd>)
                  | 'CSeq'(<Cmd>, <Cmd>)

- From a syntactic standpoint, they extend both statements and expressions, as an identifier is an expression.

π automaton semantics for π lib commands I

- A location $l \in Loc$ denotes a memory cell.
- Storable and Bindable sets denote the data that may be mapped to by identifiers and locations on the memory and environment respectively.
- $Store = Id \mapsto Storable$, $Env = Loc \mapsto Bindable$, $Loc \subseteq Store$, $\mathbb{N} \subseteq Loc, Bindable$.
- Now the transition function is $\delta : L(G)^* \times L(G)^* \times Env \times Store \rightarrow Q$, and let $W \in String$, $C, V \in L(G)^*$, $S \in Store$, $E \in Env$, $B \in Bindable$, $l \in Loc$, $T \in Storable$, $X \in <Exp>$, $M, M_1, M_2 \in <Cmd>$, and

π automaton semantics for π lib commands II

expression $S' = S/[I \mapsto N]$ means that S' equals to S in all indices but I that is bound to N,

$$\delta(Id(W) :: C, V, E, S) = \delta(C, B :: V, E, S), \tag{17}$$

$$\text{where } E[W] = I \text{ and } S[I] = B,$$

$$\delta(Assign(W, X) :: C, V, E, S) = \delta(X :: \#ASSIGN :: C, W :: V, E, S'), \tag{18}$$

$$\delta(\#ASSIGN :: C, T :: W :: V, E, S) = \delta(C, V, E, S'), \tag{19}$$

$$\text{where } E[W] = I \text{ and } S' = S/[I \mapsto T],$$

$$\delta(Loop(X, M) :: C, V, E, S) = \delta(X :: \#LOOP :: C, Loop(X, M) :: V, E, S), \tag{20}$$

$$\delta(\#LOOP :: C, Boo(true) :: Loop(X, M) :: V, E, S) = \delta(M :: Loop(X, M) :: C, V, E, S), \tag{21}$$

$$\delta(\#LOOP :: C, Boo(false) :: Loop(X, M) :: V, E, S) = \delta(C, V, E, S), \tag{22}$$

$$\delta(CSeq(M_1, M_2) :: C, V, E, S) = \delta(M_1 :: M_2 :: C, V, E, S). \tag{23}$$

π lib declarations

- Declarations are statements that create an environment, binding identifiers to (bindable) values.
- In π lib, a bindable value is either a Boolean value, an integer or a location.
- From a syntactic standpoint, all classes are monotonically extended.

  $\langle Statement \rangle$ ::= <Dec>

  $\langle Exp \rangle$ ::= 'Ref'(<Exp>)> | 'DeRef'(<Id>) | 'ValRef'(<Id>)

  $\langle Dec \rangle$ ::= 'Bind'(<Id>, <Exp>) | 'DSeq'(<Dec>, <Dec>)

  $\langle Cmd \rangle$ ::= 'Blk'(<Dec>, <Cmd>)

π automaton semantics for π lib declarations I

Let $BlockLocs = Set\{Loc\}$, now the transition function is
$\delta : L(G)^* \times L(G)^* \times Env \times Store \times BlockLocs \rightarrow Q$, and let $L, L' \in BlockLocs$,
$Loc \subseteq Storable$, and S/L means the store S without the locations in L,

π automaton semantics for π lib declarations II

$$\delta(Ref(X) :: C, V, E, S, L) = \delta(X :: \#REF :: C, V, E, S, L), \tag{24}$$

$$\delta(\#REF :: C, T :: V, E, S, L) = \delta(C, l :: V, E, S', L'), \text{ where } S' = S \cup [l \mapsto T], l \notin S, L' = L \cup \{l\}, \tag{25}$$

$$\delta(DeRef(Id(W)) :: C, V, E, S, L) = \delta(C, l :: V, E, S, L), \text{ where } l = E[W], \tag{26}$$

$$\delta(ValRef(Id(W)) :: C, V, E, S, L) = \delta(C, T :: V, E, S, L), \text{ where } T = S[S[E[W]]], \tag{27}$$

$$\delta(Bind(Id(W), X) :: C, V, E, S, L) = \delta(X :: \#BIND :: C, W :: V, E, S, L), \tag{28}$$

$$\delta(\#BIND :: C, B :: W :: E' :: V, E, S, L) = \delta(C, ([W \mapsto B] \cup E') :: V, E, S, L), \text{ where } E' \in \textbf{Env}, \tag{29}$$

$$\delta(\#BIND :: C, B :: W :: H :: V, E, S, L) = \delta(C, [W \mapsto B] :: V, E, S, L), \text{ where } H \notin \textbf{Env}, \tag{30}$$

$$\delta(DSeq(D_1, D_2), X) :: C, V, E, S, L) = \delta(D_1 :: D_2 :: C, V, E, S, L), \tag{31}$$

$$\delta(Blk(D, M) :: C, V, E, S, L) = \delta(D :: \#DEC :: M :: \#BLK :: C, L :: V, E, S, \emptyset), \tag{32}$$

$$\delta(\#DEC :: C, E' :: V, E, S, L) = \delta(C, E :: V, E/E', S, L), \tag{33}$$

$$\delta(\#BLK :: C, E :: L :: V, E', S, L') = \delta(C, V, E, S', L), \text{ where } S' = S/L. \tag{34}$$

π lib abstractions

- Abstractions extend Bindables by allowing a name to be bound to a list of formal parameters and a block in the environment.
- Such names can be called and applied to actual parameters, a list of expressions.

  $\langle Dec \rangle$ ::= 'Bind'(<Id>, <Abs>)

  $\langle Abs \rangle$ ::= 'Abs'(<Formals>, <Blk>)

  $\langle Formals \rangle$ ::= 'Formals'(<Id>*)

  $\langle Cmd \rangle$ ::= 'Call'(<Id>, <Actuals>)

  $\langle Actuals \rangle$ ::= 'Actuals'(<Exp>*)

π automaton semantics for π lib abstractions — Closures I

We chose a static binding semantics for abstractions. Therefore, we interpret abstractions as *closures* formed by an abstraction together with its declaration environment which defines the context in which the abstraction will be evaluated.

$$Closure : Formals \times Blk \times Env \rightarrow Bindable$$

π automaton semantics for π lib abstractions I

Let $F \in$ Formals, $B \in$ Blk, $I \in$ Id, $A \in$ Actuals, $V_i \in$ Value, $1 \le i \le n$, $n \in \mathbb{N}$,

$$\delta(\textbf{Abs}(F, B) :: C, V, E, S, L) = \delta(C, \textbf{Closure}(F, B, E) :: V, E, S, L) \tag{35}$$

$$\delta(\textbf{Call}(I, [X_1, X_2, \ldots, X_n])) :: C, V, E, S, L) = \tag{36}$$
$$\delta(X_n :: X_{n-1} :: \ldots :: X_1 :: C, \#\textbf{CALL}(I, n) :: V, E, S, L)$$
$$\delta(\#\textbf{CALL}(I, n) :: C, [V_1, V_2, \ldots, V_n] :: V, [I \mapsto \textbf{Closure}(F, B, E_1)]E_2, S, L) = \tag{37}$$
$$\delta(B :: \#\textbf{BLKCMD} :: C, E_2 :: V, E_1 / \textbf{match}(F, [V_1, V_2, \ldots, V_n]), S, L)$$

$$\textbf{match} : Formals \times Actuals \rightarrow Env$$
$$\textbf{match}(fl, al) = \textbf{if } |fl| \ne |al| \textbf{ than } \{\} \textbf{ else } \_\textbf{match}(fl, al, \{\})$$
$$\_\textbf{match} : Formals \times Actuals \times Env \rightarrow Env$$
$$\_\textbf{match}(\textbf{Formals}([]), \textbf{Actuals}([]), E) = E$$
$$\_\textbf{match}(\textbf{Formals}(f), \textbf{Actuals}(a), E) = \{f \mapsto a\}E$$
$$\_\textbf{match}(\textbf{Formals}(f :: fl), \textbf{Actuals}(a :: al), E) = \_\textbf{match}(\textbf{Formals}(fl), \textbf{Actuals}(al), \{f \mapsto a\}E)$$

π lib expressions in Python I

https://nbviewer.jupyter.org/github/ChristianoBraga/PiFramework/blob/
master/python/pi.ipynb

```

π automaton for π lib commands I

Environment, Location, Store and commands opcodes.

```python
## Commands
class Env(dict): pass
class Loc(int): pass
class Sto(dict): pass
class CmdKW:
    ASSIGN ="#ASSIGN"
    LOOP ="#LOOP"
```

π automaton for π lib commands II

π automaton for commands extends the π automaton for expressions.

```python
class CmdPiAut(ExpPiAut):
    def __init__(self):
        self["env"] =Env()
        self["sto"] =Sto()
        ExpPiAut.__init__(self)
    def env(self):
        return self["env"]
    def getLoc(self, i):
        en =self.env()
        return en[i]
    def sto(self):
        return self["sto"]
    def updateStore(self, l, v):
        st =self.sto()
        st[l] =v
```

π automaton for π lib commands III
π semantics for assignment.

$$\delta(Assign(W,X) :: C, V, E, S) = \delta(X :: \#ASSIGN :: C, W :: V, E, S'),$$
$$\delta(\#ASSIGN :: C, T :: W :: V, E, S) = \delta(C, V, E, S'),$$
$$\text{where } E[W] = l \text{ and } S' = S/[l \mapsto T].$$

```

55    def __evalCall(self, c):
56        '''
57        Essentially, a call is translated into a block.
58        If we were progrmming pi in a symbolic language,
59        we could simply crete a proper block and push it to the control
                                          stack.
70        However, the environment is not symbolic: is a dictionary of
                                          objects.
71        To create a block we would need to "pi-lib-fy" it, that is,
                                          recreate the
72        pi lib tree from the concrete environmnet and joint it with
                                          matches created
73        also at pi lib level. These would be pushed back into the control
                                          stack and
```
